

VC Wallet Assignment

What I built

A React website (PWA) that looks like a digital ID card wallet. All data is fake (mock). No real Aadhaar, no real APIs.

Part 1 — Credential Dashboard

- Shows a list of identity cards in a grid (works on mobile, tablet, desktop).
- Each card shows: name, issuer, type, issue date, status (Active/Expired), and a hidden ID number.
- Data comes from a mock API (`/api/credentials`). Redux Toolkit stores the data.

- Three clear states:

Loading — skeleton cards shown (mock API has a 900ms delay so you can see it).

Error — error message + Retry button.

Empty — "No credentials found".

- Buttons on the page let you switch between Success / Empty / Error to demo each state.

Part 2 — SecureDataMask

- The ID number on each card is hidden by default: `XXXX-XXXX-9012`.
- Tap "Tap to Reveal" → full number shows, button becomes "Tap to Hide".
- After exactly 10 seconds it hides itself again. You can also tap Hide anytime.
- The timer is cleaned up properly (no memory leaks).

Part 3 — Offline

- A service worker saves the last credential list. If you go offline, the app still shows the saved list. Online, it shows fresh data and re-saves it.

- The UI clearly shows "Online" (green) or "Offline" (orange).

TESTS

- Automated tests (Vitest) check SecureDataMask, including the exact 10-second timeout. Run with `npm test` (8/8 pass).

How to run

```
npm install
npm run dev    # open the app
npm test      # run tests
npm run build  # production build
npm run preview # test offline mode
```
